**Application Technique**

1. Cleanse and degrease insertion and stabilization site with chlorhexidine, alcohol or per hospital policy. Allow the targeted area to dry completely.

2. Insert catheter and connect extension set per manufacturers’ directions for use. Tighten Luer lock firmly.

3. Apply sterile transparent dressing over the insertion site per hospital protocol.

5. Align anchor pads so directional arrow points towards insertion site.

6. Press the StatLock® device retainer over the top of the Luer nut (not on sides) while supporting underneath the extension set.

**Removal Technique**

1. Remove transparent dressing and foam strip using “stretch technique.”

2. First lift corner edge of anchor pad using 3-4 stacked alcohol pads. Then continue to stroke the undersurface of the pad with alcohol to dissolve anchor pad away from skin. Do not pull or use force to remove pad. The more alcohol used, the easier the removal.

3. Discontinue the IV and remove the IV and anchor pad together.
